                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the wild-type L protein from Measles virus isolate Montefiore. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3′ genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against
              The sequence of the entire genome of the attenuated measles virus strain AIK-C has been determined and contains 6 open reading frames. The sequence of the L protein was deduced from the sixth ORF. The virus retains high immunogenicity with reduced pyrogenicity and no neurological complications.
                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus

This sequence is used in a method which involves the isolation of recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3′ genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                  Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus

L protein; attenuation; non-segmented; negative sense; vaccine; immunity; single stranded RNA virus; Mononegavirales.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the L protein from Measles virus Zagreb vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA vitus of the order Mononegavirales which have at least lattenuating mutation in the 3′ genomic promoter region and at least lattenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                     Recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Monongavizales - having attenuating mutation in 3′ genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Monongavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 53; DB 19; Length 2183; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the L protein from Measles virus Moraten vaccine. This sequence is used in a method which involves the isolation of recombinantly generated, attended, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3′ genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            L protein; attenuation; non-segmented; negative sense; vaccine; immunity; single stranded RNA virus; Mononegavirales.

This sequence is used in a method which involves the isolation of recombinantly generated, attenuated, non-seqmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                             L protein; attenuation; non-segmented; negative sense; vaccine; immunity; single stranded RNA virus; Mononegavirales.
         This sequence represents the L protein from Measles virus AIK-C vaccine. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents the L protein from Measles virus isolate 1977. This sequence is used in a method which involves the isolation of recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3′ genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           non-segmented, negative-sense,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinantly-generated, attenuated, non-segmented, negative-sense single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0;

                                                                                                                                                                                                                                                                                                                                                           This sequence represents a wild-type L protein from Measles virus isolate 1983. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
         L protein; attenuation; non-segmented; negative sense; vaccine; immunity; single stranded RNA virus; Mononegavirales.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                   Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having
                                                                                                                                                                                                                                                                                  single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

```
This sequence represents the wild-type L protein from Human parainfluenza virus (HPIV-3) type 3 isolate JS. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' peononic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      L protein; attenuation; non-segmented; negative sense; vaccine; immunity; single stranded RNA virus; Mononegavirales.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                vaccine FRhl cp45 L protein. This sequence is used in a method which involves the isolation of recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the Human parainfluenza virus (HPIV-3) type 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Monongavizales - having attenuating mutation in 3′ genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus
                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents the Human parainfluenza virus (HPIV-3) type 3 vaccine Vero cp45 L protein. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-sequented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the 3' polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               VIII; canine; dog; diagnosis; animal model; haemophilia A;

This polypeptide comprises canine factor VIII. The canine Factor VIII gene (see v99801) was obtained by concatamerisation of RT-PQR-amplified factor VIII fragments obtained from canine liver total RNA. A cDNA clone, designated pBK-cmv(1-6#3) canine FVIII, is deposited as ATCC 209475. The invention provides canine FVIII, is deposited as ATCC 209475. The invention provides canine factor CIII polypeptides encoded by such isolated nucleic acid molecules, antibodies binding to such polypeptides, penetic constructs comprising the nucleic acid molecules, prokaryotic or enkaryotic comprising canine disorders characterised by factor VIII deficiency, especially haemophilia A. A polynucleotide can be administered via a vector directly into canine cells (gene therapy). The canine can remembhilia in humans. Epitope-bearing portions of canine factor VII cutil polypeptides can be used to generate anti-canine factor VII canine factor VII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New canine factor VIII polynucleotide and polypeptide - useful for detection and treatment of haemophilia A using gene therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents canine factor VIII. The isolated factor VIII nucleic acid molecule and protein can be used for treating a disorder characterised by canine factor VIII deficiency in a canine, especially haemophilia A.
                                                                                                                                                                                                                          factor VIII; haemostatic; diagnosis; haemophilia A; dog.

Frimary structures of neuropeptides isolated from the corpora
cardiaca of various cetonid beetle species determined by
pulsed-liquid phase sequencing and tandem fast atom bombardment mass
T spectrometry.

- I- FUNCTION: THIS HORMONE, RELEASED FROM CELLS IN THE CORPORA
CARDIACA AFTER THE BEGINNING OF FLIGHT, CAUSES RELEASE OF
DIGLYCERIDES FROM THE FAT BODY AND THEN STIMULATES THE FLIGHT
MUSCLES TO USE THESE DIGLYCERIDES AS AN ENERGY SOURCE.

- SIMILARITY: BELONGS TO THE AKH / HRTH / RPCH FAMILY.

R PIR: S15422: S15422.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cydia pomonella (Codling moth).

A.FILLE: Isolation and amino acid sequence of the 30S ribosomal protein S19 from Mycobac A. Reference number: 536887; MUID: 94009653
A. Accession: S3698
A. Status: preliminary
A. Molecule type: protein
A. Residues: 1-9 < OHA>
C. Keywords: protein blosynthesis; ribosome

S39437
D-and-acid oxidase (EC 1.4.3.3) - Trigonopsis variabilis (fragment)
C;Species: Trigonopsis variabilis
C;Species: Trigonopsis variabilis
C;Date: 19-Mar-1997 #sequence_revision 05-Dec-1997 #text_change 07-May-1999
C;Accession: S39437
R;Schraeder, T.; Andreesen, J.R.
Eur. <sup>1</sup>J. Blochem. 218, 735-744, 1993
A;Title: Evidence for the functional importance of Cys298 in D-amino acid oxidase from A;Reference number: S39437; MUID:94094869
A;Accession: S39437
A;Molecule type: protein
A;Residues: 1-9 <SCH>
A;Experimental source: CBS 4095
C;Function:
A;Description: oxidoreductase; catalyzes; the oxidation of D-amino acids to their corresp
A;Note: reoxidation of the enzyme by molecular oxygen is accompanied by the release of P;C;Reywords: FAD; oxidoreductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SESSON STATEMENT OF THE PROPERTY OF STATEMENT OF STATEMEN
